

Announcing Groundbreaking, One-Day Professional Development

This Professional Development, taught by Jon Zahourek, founder of the ANATOMY IN CLAY® Learning System, will rely on two proven techniques for learning anatomy: alternating back and forth between the experimental process of building clay onto MANIKEN® models, and the inductive analysis of examining the preserved cadaveric specimen. We will build from inside-out and also examine outside-in, providing a fully immersive, project-based education.

In this class you will build and prosect muscles of the upper extremity; understanding their form, function, and biomechanics in an exciting, intellectually active way.
